

GIACHETTO

Python Developer | Data Engineering | Analytics Systems

Remote – Brazil | Email: your@email.com | GitHub: github.com/yourprofile | LinkedIn: linkedin.com/in/yourprofile

PROFESSIONAL SUMMARY

Python developer focused on data engineering, analytics systems, and automation. Experienced in building scalable data pipelines, processing large datasets, and developing high-performance services using modern Python ecosystems. Strong background working with Linux environments, cloud infrastructure, and data processing workflows that transform complex datasets into actionable insights.

TECHNICAL SKILLS

Programming	Python, REST APIs, Data Processing Pipelines, Automation
Data Libraries	Pandas, NumPy, SciPy, Matplotlib
Infrastructure	Linux, Docker, CI/CD, Cloud Platforms (AWS / GCP)
Databases	SQL Systems, MongoDB, Redis
Tools	Git, Automated Testing, Debugging, Performance Optimization

PROFESSIONAL EXPERIENCE

Python Developer – Data Systems & Automation (Remote | 2021 – Present)

- Developed Python applications for large-scale data processing and analytics workflows.
- Designed automated data pipelines for ingestion, transformation and analysis of datasets.
- Built modular backend services integrated with REST APIs and cloud infrastructure.
- Developed visualization tools to support data exploration and analysis.
- Managed Linux environments and application deployment on cloud servers.
- Optimized Python code improving scalability, performance and maintainability.

PROJECTS

Data Pipeline for Market Data Analytics

- Developed scalable Python pipeline to collect financial market data from public APIs.
- Automated ingestion, cleaning and transformation of structured datasets.
- Stored processed datasets for analytical workflows and visualization.
- Containerized the pipeline using Docker for reproducible deployments.

Analytics Dashboard for Dataset Exploration

- Built data processing scripts to convert raw datasets into analysis-ready formats.
- Implemented visualization modules for exploring trends and patterns in data.
- Created automated workflows to update dashboards when new data becomes available.

High Performance Data Processing System

- Designed modular Python services to process large datasets efficiently.
- Implemented Redis caching to improve performance of data queries.
- Built scalable architecture suitable for analytics and automation pipelines.

Automated Web Data Collection System

- Developed Python scripts to collect structured data from multiple web sources.
- Implemented parsing and transformation pipelines for large scraped datasets.
- Created automated scheduling scripts for continuous data collection.
